TEAM INITIATORS · DISTRICT IQ REVIEW · 18 OCT 2026, 4:45 PM

Intro and Overview page

For [friend's name] · about 9 minutes: the pitch, then the Collector's Overview page

About 9 minutes: a 5-minute pitch, then a 4-minute walk through the Collector's Overview page. Your job is to make the judges care, then show them the first screen. Speak slowly, look at the judges, and pause after every bold line. Yellow lines are what to click.

1 · Opening `0:00 – 0:40`

SAY

Good afternoon, everyone, and thank you for having us.

We are **Team Initiators**. I'm [friend's name], and this is [your name]. Today we're going to show you **District IQ**: an intelligence platform that helps the Collector of Chennai see the whole district on one screen, and know exactly what needs attention first.

I'll explain why we built it and what makes it different, and then walk you through the Collector's main screen. After that, [your name] will take you behind it: the data, the intelligence, and how it reaches the officers and the citizens.

2 · The problem: one morning in Chennai `0:40 – 1:50`

SAY

I'd like you to imagine a morning after heavy rain in Chennai.

By eight o'clock, the Collector's office is already flooded too, with information. Citizens have filed complaints about waterlogged streets. The police have logged calls about a fallen tree. PWD has opened work orders for blocked drains. IMD has issued a warning. And the newspapers, in English and in Tamil, are already reporting all of it.

All of this is useful. But it arrives from **a dozen different places**, in different formats, at different times, and **none of it talks to each other.**

So the same waterlogged street can show up as seven separate reports. Nobody can see that it's one problem. And nobody can answer the two questions that actually matter to a Collector: **What is really happening in my district? And what needs me first?**

Today, that answer depends on phone calls, meetings and a lot of experience. We believe it should take **one screen.**

3 · Our vision `1:50 – 2:20`

SAY

So our vision for District IQ was simple. Not another dashboard that shows **more data**, but a system that shows **less, but the right things**, and always explains why.

It should collect on its own, connect the dots on its own, and give the Collector a clear, trustworthy picture every single morning.

4 · What makes it different `2:20 – 3:50`

SAY

There are five things we're especially proud of, and you'll see every one of them today.

First, it never sleeps. Every hour, it collects fresh data on its own: weather and warnings, flood levels, air quality, lake levels, market prices and news. And it does it responsibly. It never breaks into a website or bypasses a captcha.

Second, it connects the dots. Seven reports about one street become **one incident**, even when one report is in Tamil and another is in English. Matching a Tamil report with an English one, when they share almost no words, was one of the hardest things we built.

Third, it explains itself. Every incident has a priority, and the reasons are written right next to it. Nothing is a black box. And over time, it learns from the Collector's own decisions.

Fourth, you can trust its numbers. We use AI where it genuinely helps: to read, match and write. But **every number is checked against the real data** before anyone sees it. Even our chatbot is built so that it cannot invent a figure.

And fifth, it closes the loop. The Collector can send work to a department, the officer has to show photo proof that it's done, and the citizen who complained can see that proof too. **One system, from the citizen's complaint to the Collector's decision, and back.**

5 · Who it serves `3:50 – 4:15`

SAY

It serves three kinds of people. **The Collector**, who sees the whole district. **Department officers**, 25 departments, each with a clear queue of their own work. And **citizens**, who can file a complaint in a few taps and follow it until it's done. All of it works in **Tamil as well as English.**

6 · The data, honestly `4:15 – 4:45`

SAY

We also want to be upfront about our data, because we think that matters.

All the **public data is real and live**: about fifteen thousand news articles in English and Tamil, plus IMD, the flood monitor, air quality, lakes and market prices. The department records (complaints, police, PWD and hospitals) are **realistic simulations**, because those departments don't publish open data. They follow Chennai's real wards and real rain days. Connecting a real department later is **one small connector, not a rebuild.**

7 · Our journey, and into the screen `4:45 – 5:15`

SAY

Building this was a real journey for us. We've been through **more than twenty-five rounds** of building, testing and rebuilding, and every round started by asking: would a Collector actually trust this? We measured everything, found what was wrong, and fixed it.

So rather than tell you more, let me show you what the Collector actually sees.

8 · The Collector's morning screen `5:15 – 6:15`

DO **Collector console on the Overview page, shared on screen. Point at the greeting band and the four tiles.**

SAY

This is the Collector's screen: exactly what the Collector of Chennai would open at eight in the morning. It greets them, and straight away answers the first question: **what is happening in my district?**

These four tiles are the pulse of the district: **severe events, open complaints, ongoing incidents, and what's been resolved.** Each one is compared with the previous period, so the Collector instantly knows whether things are getting better or worse. And under each number, it says it in plain words, like how many are still open and how many are closed.

We actually started with tiny trend charts on every tile. But a Collector reads this at a glance, and at a glance **a sentence is quicker than a squiggle**. So we replaced them with plain words.

DO **Click one tile to show its list, close it. Then switch the period: Daily → Weekly → Monthly, and leave it on Weekly.**

SAY

Every number here is clickable. [Click a tile.] This is the list behind it, so the Collector never has to take a number on faith.

And the Collector chooses the time frame: today, this week, this month or this quarter. [Switch the period.] **Everything on the page follows that choice**, from the tiles to the map to the news.

---

9 · The map: one click, one zone `6:15 – 7:15`

DO **Point at the map. Switch Zones ↔ Taluks. Then click one zone and let the whole page change. Then clear it.**

SAY

Here's the district on a map. All 15 zones of the Greater Chennai Corporation, or, with one switch, the revenue taluks. Darker areas have more incidents, and the pins show what is severe, what came from citizen complaints, and our live stations: air quality, rain gauges and lakes.

Now watch this. [Click a zone.] When I click a zone, **the whole console becomes that zone.** The numbers, the lists, the news, even the briefing. And the snapshot here even shows the **zonal officer** responsible, so the Collector knows exactly who to call. A zonal review meeting becomes one click.

One small detail that mattered a lot to us. A lot of news just says "in Chennai", with no street or area. If we pinned all of those, they would pile up in one spot and draw a huge hotspot that doesn't exist. So if we don't know exactly where something happened, **we don't put it on the map**. We list it separately, right here below the map. The map should never mislead the Collector.

DO **Clear the zone.**

---

10 · What's urgent, what's waiting, what's in the news `7:15 – 8:15`

DO **Point at "Open, by severity" and click through Severe → High. Then point at "My Tasks". Then "Latest news", and click its "Next door" tab.**

SAY

Next to the map, **Open, by severity** splits every open incident into severe, high, medium and low, so the most dangerous things are always one click away.

Then **My Tasks**. This is work that departments say they've finished, waiting for the Collector to check. [Your name] will show you that whole loop in a few minutes, from the officer's side and the citizen's side.

And **Latest news**: what the newspapers are saying, already grouped, so one event reported by five outlets shows up once, not five times.

[Click Next door.] And this tab is one of our favourites. Chennai doesn't flood only because of Chennai. If a lake upstream in Tiruvallur or Chengalpattu releases water today, it reaches Chennai tomorrow. So **Next door** watches the news from the three neighbouring districts and flags what could reach us. It's **early warning from beyond the district boundary.**

11 · Built around the Collector `8:15 – 8:45`

DO **Point at the top bar: press "/" to open search, close it; open Customize (sliders icon), close it; point at Export, Workspaces, the bell and the light/dark switch.**

SAY

Finally, we wanted the console to fit the Collector, not the other way round. They can **search everything** with a single key. [Press /.] They can **customise** the screen, hiding or reordering tiles and pages. They can save a view as a **workspace** and come back to it. They can **export** a PDF report or an action list for a meeting. The bell shows new alerts, and it works in light or dark mode.

12 · Handover `8:45 – 9:00`

SAY

So that's what the Collector sees every morning. But the real question is: **how does it know all this?** How does it turn thousands of scattered reports into one clear picture, and how does it reach the officers and citizens?

[Your name] will take you behind the screen. [Your name], over to you.

Delivery tips: learn sections 2 and 4 almost by heart; they carry the pitch. Say "five things" and count them on your fingers. On the screen, say what you're about to click before you click it, then let the screen change before you explain it. If a judge asks a deep technical question, answer in one line and say, "[your name] will show exactly that in a minute." Hand over with energy.
